APPLICATION AND DESCRIPTION

MFT-FOX VI-1L-wood

The system consists of aluminium brackets and mounting element, and the system is specifically designed for vertical substructures in ventilated facades in combination with timber battens.

The brackets are supplied with pre-assembled isolators and, according to the method of installation to the base material – anchors, screws or direct fastening – with different hole geometries in the base plate (available hole geometries are shown in the catalogue or on the following pages). Additional to the brackets the system consists of bracket extensions to connect the timber battens to the brackets.

The adjustment of the profiles against the brackets is facilitated by a ‘helping hand’. The helping hand keeps the profile in position whilst the profile is being fixed with screws, allowing a fast connection to the bracket. With this system, wall tolerances of up to 40 mm can be perfectly balanced. The brackets are available in 3 different sizes (large, medium & small) from 40 mm to 300 incl. 6 mm isolator in 20 mm increments. The isolator separates the substructure from the base material to reduce thermal bridging.

The timber battens are fixed with stainless steel screws to the mounting element .

Advantages

- Flexible design using fixed and flexible points
- 3 different sizes of brackets (large, medium & small)
- Different sizes of bracket extensions
- 40 mm adjustment capability of the profiles in the brackets
- Brackets can be mounted using a range of methods - anchors, screws or direct fastening
- 6 mm isolator separates the substructure from the base material to reduce thermal bridging
- Substructures can be designed with PROFIS Facade to generate technically-sound and economically optimized solutions
- Can be used with all common cladding materials
